

GitHub Copilot for Business Analysts

A 90-minute hands-on lab

Build your own GitHub project space, write a structured spec, refine it with Copilot, and publish it — **without writing a single line of code.**

Facilitator: Kousik Nagarajan · Microsoft

Audience: Business Analysts

Format: Hands-on · Bring your own laptop

Why we're here

Your **BAs live in Confluence**. Your **devs live in GitHub / ADO**.

In between, requirements get **lost in translation** — copied to Teams, summarised into tickets, paraphrased in PRs.

The cost isn't measured in hours. It's measured in **rework, defects, and systems that don't behave the way you asked**.

Today we build a **new home for requirements** where:

-  You still write the way you always have — prose, headings, tables, diagrams
-  The spec **lives next to the code** that implements it
-  **Copilot is your co-author** — not a developer's tool

The 90-minute arc

#	Section	Time	What you'll do
0	Overview & fork the repo	10	Get your own forked project space
1	Project spaces	15	Create Project board + first Issue
2	Structured specs (spec kit)	15	Write Overview + Persona by hand
3	Refine with Copilot ★	20	Prose → Gherkin in one prompt
4	Change management	15	Draft → page review → publish
5	End-to-end trace	10	Issue ↔ Spec ↔ PR ↔ board
—	Q&A + pick the trial mini-project	5	Take it home

How this works · what you take home

Ground rules

-  **You drive your own keyboard.** Don't watch — *do*.
-  **React in chat** at every checkpoint so the room moves together.
-  **Stop me whenever it stops looking like Confluence** — that's the whole point.
-  **Stuck?** Drop a message in the lab chat. See `STUCK.md` .

You'll leave with

-  Your **own forked repo** — keep it, share it, start using it Monday
-  A **2-week trial plan** picked from this room
-  Re-usable **templates and Copilot prompts**
